

ABSTRACT OF THE DISCLOSURE

A stabilized OLED device for emitting light of a specific color includes a metallic anode and a metallic cathode spaced from the metallic anode. The device also includes a light-emitting layer including a host and a dopant, the
5 dopant selected to produce light having a spectrum including light of the specific color, and a stabilizer provided in one of the device layers which improves the useful lifetime of the OLED device, wherein the stabilizer has an emission spectrum different from that of the light-emitting layer. One of the electrode
layers is semitransparent and the other one is substantially opaque and reflective
10 such that the stabilized OLED device forms a microcavity that emits a narrow band light with the specific color.
